

# M2C3 Project

## Safe Water for School Task

### Student Work

This file includes different solution paths for students in grades 3, 4, and 5. Students used whole number addition, multiplication, and division to determine the number of large jugs of water needed to supply their class with clean water for a set amount of time.

# Factors that Students Considered

- How much water each student drinks per day
- If students bring water bottles (with water) from home
- How long a school day is and what activities (e.g. recess, P.E. class) and factors (e.g. the time of year, weather) influence water consumption

# Connections to Students' Experiences

- Students drink water in school and some classrooms have water dispensers in them.
- Schools and cities test that water is safe to drink, and some students have experienced dealing with unsafe water in their city.
- Many students have learned about the water crisis in Flint, Michigan.

# What do you Know, Need to Know, Assume?

Grade 4 students **made sense of the task** by brainstorming a chart of what they knew, what they needed to know or find out, and what they could assume about calculating the amount of drinking water needed for their class for one school day.

This class had 28 people (adults and students) and they knew the number of hours they spent at school each day. They needed to find out the amount of water in 1 large jug and how much each person drinks per day. They assumed some people bring water bottles to school.

**If our water fountains were unsafe, how many large jugs of water would we need to make sure that everyone in our class has enough drinking water for 1 school day?**

What do we KNOW that will help us?	What do we need to know or find out?	What do we need to decide? What assumptions do we need to make?
28 people total	how much water in 1 Jug?	Some people bring water bottles
the hours of each school day	how much water does 1 person drink on average	Adults are included

# What do you Know, Need to Know, or Assume/Decide?

Grade 4 students knew their class size and that not everyone drinks water. They knew that they tend to drink more water when they are active, like during P.E., music class, and recess. They needed to find out how much water each person would drink and who would bring their own water bottle. They had to make some assumptions about how often students would be able to get water from the dispenser.

Water Task

What do we KNOW that will help us?	What do we NEED TO KNOW or find out?	What DECISIONS/ASSUMPTIONS do we have to make?
<ul style="list-style-type: none"><li>people in our class (26)</li><li>drink more water around P.E./recesses</li><li>5 gal in jug</li><li>1.07 liters</li><li>Not everyone drinks water</li></ul>	<ul style="list-style-type: none"><li>How much water people drink?</li><li>How many people have water bottles?</li><li>How much average person drink</li><li>do we all have cups?</li><li>How much water in the cups?</li></ul>	<ul style="list-style-type: none"><li>How often people can get water?</li><li>how much is in a cup?</li><li>how many people have cups or water bottles</li></ul>

# Grade 3 Solution

This group divided the 22 students into two groups by age (8- and 9-year-olds) because they needed different amounts of water. In a repeated addition model, they decomposed 16 (cups in a gallon) to find the total number of cups needed for the class, which was 155. They stated that 2 large jugs are required, unless adults are also included; then they would need an additional jug.

**What are your assumptions?**  
 (How many people? How many adults and how many children? How much water does each person get? Do they drink all their water at school?)

**Show your math here:**

**How many large jugs of water do we need?**  
 Write your plan here:

Everyone in the javeline room in total needs 155 cups of water because there are 7 8 year olds and 15 9 year olds. So there are 16 cups in a gallon. And there 5 gallons in each Jug. And there 80 cups in Jug and  $24 \times 10 = 160$ . And everyone needs 100 and 55. In conclusion you only need to 3 jugs of water in a day.

16 cups of water in a gallon  
 A large jug of water has 5 gallons  
 $16 \times 5 = 80$   
 $16 + 16 + 16 + 16 + 16 = 80$   
 $20 \quad 20 \quad 10$   
 $40 + 10 = 50$   
 $6 + 6 + 6 + 6 + 6$   
 $12 + 12 + 6$   
 $24 + 6 = 30$

a jug of water has 50 caps.  
 $3 \times 15 = 120$   
 $5 \times 10 = 50$   
 $40 + 20$   
 $160 - 155 = 5$   
 $7 \times 5 = 35$   
 $120 + 35 = 155$   
 $50 + 20 = 100$   
 $100 + 20 = 120$   
 $30 + 50 = 80$   
 We only need 2 jugs of water.

The classroom will need 2 jugs of water but including the adults we would need 3 jugs because there are two adults and they drink 10 caps it would basically be 3 jugs.

7 people need 5 cups a day  
 15 people need 3 cups of water per day.  
 $7 + 15$   
 $10 + 7 = 17 \quad 17 + 15 = 22$

# Grade 4 Solution

These students decided that their class needs 3 large jugs of water for one day, based on assumptions that each student gets 64 ounces and there are 27 kids. They found the total number of ounces needed (1,728) and compared this to the total number of ounces in 3 jugs.

<p>Important assumptions and decisions made</p> <p>64 ounces per person</p> <p>27 kids in our class</p> <p>1,728 ounces for everyone in the class.</p>	<p>How many large jugs of water do we need? <u>3</u></p> <p>Use pictures, numbers, and words to show that your plan will work.</p> <p>64 ← ounces per person  <math>\times 27</math> ← kids in class</p> $\begin{array}{r} 1200 \\ 420 \\ 80 \\ 28 \\ \hline 1728 \end{array}$ <p>1,728 ounces for the whole class</p> <p>4 × 7 = 28          60 × 20 = 1,200          60 × 7 = 420          4 × 20 = 80</p> <p>128  <math>\times 5</math>          640 ← ounces in 1 jug</p>
<p>What directions would you give a student who wanted to make a plan for safe water for their class?</p> <p>1,640 ounces per person</p> <p>2,640 ounces = 1 JUG</p> <p>5,27 kids in our class</p> <p>3,128 ounces in 1 gallon</p> <p>4,5 gallons in 1 jug</p>	

# Grade 4 Solution

This group decided that 2 jugs of water was sufficient since they assumed 7 kids in their class would bring water bottles from home. The total number of ounces required for the remaining 20 students was 1,120 or 8 gallons and 96 ounces. So the 2 jugs (which is 10 gallons) is enough.

This group attempted to write out generalized steps and necessary information for others who wanted to solve this task. Generalizing was typically a challenging step for students.

<p>Important assumptions and decisions made</p> <p>We assumed that seven kids would bring water bottles. we assume that 20 would not bring water bottles.</p>	<p>How many large jugs of water do we need? <u>2 Jugs</u></p> <p>Use pictures, numbers, and words to show that your plan will work.</p> <p>128 ounces = 1 gallon 5 gallon = 1 Jug 20 kids should drink 1,120 ounces. 1,120 ounces = 8 gallon 96 ounces</p> <p>2 Jugs</p>
<p>What directions would you give a student who wanted to make a plan for safe water for their class?</p> <p>Find out how many ounces kids are drink. Find out how many gallon are in the ounces. Find out how many jugs.</p>	

These students calculated the number of jugs needed for 1 day and 1 week. They assumed that students only need 5 cups of water since they are not at school all day, but teachers need more water. In all, they needed 118 cups, which is 7 gallons and 6 cups. This can be covered by 2 large jugs, with 2 gallons and 10 cups left over.

## Grade 5 Solution

For the week total, they did not simply multiply the one-day amount by 5, since that would not account for the leftovers from each day. Instead, they recalculated the total number of cups needed and found that only 8 large jugs are required for the week.

**Plan**

1 day

Each student will get 5 cups because we are not here all day.  
The teachers will get 9 cups because they come before school and after school.

1 week

In one week each student will get 25 cups.  
The leftover water will be for the plants and trees out side.

How many large jugs of water do we need 2 .  
1 week = 8 jugs

1 day

<sup>cups</sup> <sup>students</sup>  
 $5 \times 20 = 100 \text{ cups} = 6 \text{ gallons } 4 \text{ cups}$

<sup>cups</sup> <sup>teachers</sup>  
 $9 \times 2 = 18 \text{ cups} = 1 \text{ gallon } 2 \text{ cups}$

$6 \text{ gallons } 4 \text{ cups} + 1 \text{ gallon } 2 \text{ cups} = 7 \text{ gallons } 6 \text{ cups}$

1 week

<sup>cups</sup>  
 $25 \times 20 = 500 \text{ cups} = 31 \text{ gallons } 4 \text{ cups}$

$45 \times 2 = 90 \text{ cups} = 5 \text{ gallons } 10 \text{ cups}$

$31 \text{ gallons } 4 \text{ cups} + 5 \text{ gallons } 10 \text{ cups} = 36 \text{ gallons } 14 \text{ cups}$

$36 \text{ gallons } 14 \text{ cups} - 7 \text{ gallons } 6 \text{ cups} = 29 \text{ gallons } 8 \text{ cups}$

$29 \text{ gallons } 8 \text{ cups} - 21 \text{ gallons } 18 \text{ cups} = 8 \text{ gallons } 20 \text{ cups}$

$8 \text{ gallons } 20 \text{ cups} - 2 \text{ gallons } 10 \text{ cups} = 6 \text{ gallons } 10 \text{ cups}$

$6 \text{ gallons } 10 \text{ cups} - 4 \text{ gallons } 2 \text{ cups} = 2 \text{ gallons } 8 \text{ cups}$

$2 \text{ gallons } 8 \text{ cups} - 2 \text{ gallons } 10 \text{ cups} = 2 \text{ gallons } 2 \text{ cups}$

# Grade 5 Solution

This class found the amount of water required for a one month at school. They chose May as their month, which included 21 school days. They assumed only 3 cups of water per person. They wrote out equations to model: 75 cups per day multiplied by 21 days meant 1,575 cups, which they divided by 16 to get 98 gallons and 7 cups. They rounded this up to 99 gallons. Then they divided 99 by 5 (gallons in a jug) to find the total number of jugs. They rounded this to 20 large jugs, since 19 jugs would not have been enough.

**ASSUMPTIONS AND DECISIONS**

May is the month (21 days at school)  
25 people in class  
Measured in gallons  
Everyone drinks 3 cups a day at school

**LARGE JUGS NEEDED** 20

**WORK THAT PROVES YOUR SOLUTION:**

C = cups  
P = people  
D = Days  
m = month  
J = Jugs  
G = Gallon

$$\frac{C}{3} \times P = 75 \text{ cups per day}$$
$$75 \times 21 = 1575 \text{ cups per m}$$
$$1575 \div 16 = 98 \text{ r } 7 = 99$$
$$99 \div 5 = 19 \text{ r } 4 = 20$$

**EQUATION OR FORMULA:**

$$25 \text{ people} \times 3 \text{ cups} = 75 \text{ cups per day}$$
$$75 \text{ cups} \times 21 \text{ days of May at school} = 1575 \text{ CUPS per 1 month}$$
$$1575 \div 16 = 98 \text{ r } 7 \text{ round } 99$$
$$99 \div 5 = 19 \text{ r } 4 \text{ round } 20$$

# Analyzing and Comparing Solutions

This **fourth-grade** class made a chart to compare and analyze plans after all groups completed the task. The chart showed assumptions about people included and the daily water allowance. Nearly every group proposed a different total number of large jugs needed for the class. There was also variation in the amount of water left over.

Number of People	Water per Person per School Day	Total number of 5 gallon jugs needed	Leftover water?
29	8 cups	3	1 <u>cup</u> ?
27	10 cups	4	
27	8 cups	2 jugs, 3 gallons and 8 cups about 3 jugs	1 gallon and 8 cups
27	8 cups	3 jugs 14 gallons	
27	7 cups	About 3	12 cups
